                                                                                                                                                                                                                                                                                                                                                                            The present sequence represents an lytic peptide which is used in the course of the inventin to produce transgenic poinsettia plants with increased resistance to pathogens. The specification describes methods for the in vitro regeneration of Poinsettia. Transgenic Poinsettia can now be produced with e.g. increased resistance to pathogens or insects, controllable flower colour, modified habit (more compact form, earlier
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      In vitro regeneration of Poinsettia - us containing casein hydrolysate, used to previate, e.g. increased disease resistance, altered habit and flowering time
                                                                                                                                                                                                                                                                                                                   Sequence

                                                                                                                                                                                                                                                                                                                                                          The present sequence represents an antimicrobial peptide. The present invention also describes a method of conferring microbial resistance on a plant cell comprising transforming the cell to express two peptides selected from the magainin and PGL classes, where the peptides are separately compartmentalised. The antimicrobial peptide is effective against phytopathogenic microbes including bacteria, fungi, and phytoplasma. It can also be used to target other plant pests, such as nematodes and viruses. The nucleic acid sequence encoding the peptide can be used to transform plants to provide antimicrobial resistance. The method is especially useful in preventing powdery mildew. The method allows for levels of peptide expression to provide resistance to phytopathogenic microbes without otherwise affecting the plant cells.

The peptides are of a specified formula and display a wide range of antimicrobial activities and are therefore useful for preserving materials susceptible to microbial degradation, for protecting plants against bacterial infection and in the therapeutic and prophylactic protection of animals against bacteria, fungi and viruses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       WPI;

Magainins are a class of substantially pure, homogeneous
polypeptides composed exclusively of about 25 amino acids, having a
mol. wt. of about 2500 or less, being water soluble at a concentration
of greater than 5 mg/ml at neutral pH or in an aq. solution of
physiologic ionic strength. They are amphiphilic surface-seeking and ha
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         (Note: Revised entry submitted to correct the patent number format of US Government-owned NTIS applications to prevent clashes with ongoing granted patent numbers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This magainin III polypeptide has a mol. wt. of 25kD or less, is water sol. and non-cytolytic to animal cells, incl. RECs, and is amphiphilic. It is an active antimicrobial agent being effective against both Gram-positive and -negative bacteria. It is also effective against fungi and protozoa. It is therefore useful as an antibiotic.

```
Analogues have the same activity as Megainin I and II coupled with insignificant haemolytic action against human red blood cells. Useful as antibiotics, fungicides, spermicides, in destroying tumors and as preservatives and in sterilisation of food etc.
                                                                                                                                                                                      Deletion analogues of Magainin I and II peptide(s) - having high activity against microorganisms with low haemolytic action against human red blood cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       a broad spectrum of properties at physiologic ionic strength and pH. The polypeptide is a microbial agent capable of inhibiting the growth or proliferation of gram-positive and gram-negative bacteria, fungi, virus and protozoan species. They are also useful as therapeutic cytotoxic agents. This includes antitumour activity. They are useful as spermicides and as a contraceptive agent. Magainin is active against HTLV III in vitro and has the potential to reduce the infectivity of the AIDS virus indicating its use as a sterilant against the virus or as a chemotherapeutic agent for treating tree.
                                                                                                                                                                                                                                                                                                  (SCRI-) SCRIPPS CLINIC AND
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Magainin II; antibiotic; spermicide;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           (Note: Revised entry submitted to correct the patent number format of US Government-owned NTIS applications to prevent clashes with ongoing US granted patent numbers.                                                                                                 The substitution analogue has biological activity equal to or greater than the parent Magainin II peptide. The analogue is effective as antibiotic and can be used to inhibit, prevent or destroy the growth or proliferation of microbes such as Grampositive and Grampogative bacteria, fungi, viruses and protozoa. It can also be used as a spermicide to inhibit, prevent or destroy the motility of sperm and as anti-tumour agent to inhibit the growth of or destroy tumours.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Magainin I; antibiotic;

                Magainin I; magainin II; substitution analogue; antibiotic; antiviral; antitumour.
                                                       Magainin
                                                                                                                                                                                                                                                                                         The substitution analogue has biological activity equal to or greater than the parent Magainin II peptide. The analogue is effective as antibiotic and can be used to inhibit, prevent or destroy the growth or proliferation of microbes such as Grampositive and Gram-negative bacteria, fungi, viruses and protozoa. It can also be used as a spermicide to inhibit, prevent or destroy the motility of sperm and as anti-tumour agent to inhibit the growth of or destroy tumours.

                                                                                                                The substitution analogue has biological activity equal to or greater than the parent Magainin II peptide. The analogue is effective as antibiotic and can be used to inhibit, prevent or destroy the growth or proliferation of microbes such as Grampositive and Grampegative bacteria, fungi, viruses and protozoa. It can also be used as a spermicide to inhibit, prevent or destroy the motility of sperm and as anti-tumour agent to inhibit the growth of or destroy tumours.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Score

FIUNCTION. CAN CATALYZE THE HYDROXYSIS OF ATP IN THE PRESENCE OF SINGLE-STRANDED DNA. THE ATP-DEPENDENT UPTAKE OF SINGLE-STRANDED DNA BY DUPLEX DNA, AND THE ATP-DEPENDENT HYBRIDIZATION OF HOMOLOGOUS SINGLE-STRANDED DNAS. IT INTERACTS WITH LEXA CAUSING ITS ACTIVATION AND LEADING TO ITS AUTOCATALYTIC CLEAVAGE.

-I- SUBCELLULAR LOCATION: Cytoplasmic (By similarity).

Submitted (NOV-1994) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: OXIDIZES MANNITOL TO MANNOSE. PROVIDES THE INITIAL STEP
BY WHICH TRANSLOCATED MANNITOL IS COMMITTED TO CENTRAL METABOLISM
AND, BY REGULATING MANNITOL POOL SIZE, IS IMPORTANT IN REGULATING
SALT TOLERANCE AT THE CELLULAR LEVEL (BY SIMILARITY).
-!- CATALYTIC ACTIVITY: D-mannitol + NAD(+) = D-mannose + NADH.
-!- COPACTOR: ZINC (BY SIMILARITY).
-!- SIMILARITY: BELONGS TO THE ZINC-CONTAINING ALCOHOL DEHYDROGENASE
FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                    VNUC_INCCA
